

Tomas Vondra <tomas.vondra@2ndquadrant.com>

## Agenda

- Quick intro into planning and estimates.
- Estimates with correlated columns.
- CREATE STATISTICS to the rescue!
  - functional dependencies
  - ndistinct
- Future improvements.

## **ZIP\_CODES**

```
CREATE TABLE zip_codes (
   zip_code INT PRIMARY KEY,
              TEXT,
   city
              TEXT,
   state
   county
              TEXT,
   latitude
              REAL,
   longitude
              REAL
cat no_postal_codes_utf.csv | \
   psql test -c 'copy zip_codes from stdin \
                 with (format csv, header true)'
  https://www.aggdata.com/free/norway-postal-codes
```

#### **EXPLAIN**

## reltuples, relpages

```
SELECT reltuples, relpages
  FROM pg_class
WHERE relname = 'zip_codes';
```

#### Nordic PGDay 2018 Oslo, March 13, 2018

```
SELECT * FROM pg_stats
 WHERE tablename = 'zip_codes' AND attname = 'city';
schemaname
                     public
tablename
                     zip_codes
attname
                     city
                     {Oslo, Trondheim, Bergen, ...}
most_common_vals |
                     {0.140359,0.0301705,0.0255794,...}
most_common_freqs |
```

4574 \* 0.140359 = 642.002066

#### **Underestimate**

```
EXPLAIN (ANALYZE, TIMING off)
SELECT * FROM zip_codes WHERE city = 'Oslo' AND county = 'Oslo';
                         QUERY PLAN
Seq Scan on zip_codes (cost=0.00..108.61 rows=90 width=36)
                        (actual rows=642 loops=1)
  Filter: ((city = 'Oslo'::text) AND (county = 'Oslo'::text))
  Rows Removed by Filter: 3932
Planning time: 0.276 ms
Execution time: 1.962 ms
(5 rows)
```

$$P (A \& B) = P(A) * P(B)$$

4574 \* 0.0196 = 89.65

#### **Overestimate**

```
EXPLAIN (ANALYZE, TIMING off)
SELECT * FROM zip_codes WHERE city = 'Oslo' AND county != 'Oslo';
                         QUERY PLAN
Seq Scan on zip_codes (cost=0.00..108.61 rows=552 width=36)
                        (actual rows=0 loops=1)
  Filter: ((city = 'Oslo'::text) AND (county != 'Oslo'::text))
  Rows Removed by Filter: 4574
Planning time: 0.180 ms
Execution time: 1.470 ms
(5 rows)
```

## **Correlated columns**

- Attribute Value Independence Assumption (AVIA)
  - may result in wildly inaccurate estimates
  - both underestimates and overestimates
- consequences
  - poor scan choices (Seq Scan vs. Index Scan)
  - poor join choices (Nested Loop)

#### Poor scan choices

```
Index Scan using orders_city_idx on orders
  (cost=0.28..185.10 rows=90 width=36)
  (actual rows=12248237 loops=1)
```

```
Seq Scan using on orders
  (cost=0.13..129385.10 rows=12248237 width=36)
  (actual rows=90 loops=1)
```

## Poor join choices

# functional dependencies (WHERE)

# **Functional Dependencies**

- value in column A determines value in column B
- trivial example: primary key determines everything
  - zip code → {city, county, state}
  - 1792 → Tistedal → Halden → Ostfold
- other dependencies:
  - city → county
  - county → state

#### **CREATE STATISTICS**

```
CREATE STATISTICS s (dependencies)
   ON city, state, county FROM zip_codes;
   2   3   4

ANALYZE zip_codes;
SELECT stxdependencies FROM pg_statistic_ext WHERE stxname = 's';
```

#### stxdependencies

```
{"2 => 3": 1.000000, "2 => 4": 0.985789, 
"3 => 2": 0.140359, "3 => 4": 0.140359, 
"4 => 2": 0.207040, "4 => 3": 0.995846, 
"2, 3 => 4": 0.985789, 
"2, 4 => 3": 1.000000, 
"3, 4 => 2": 0.207477} 
(1 row)
```

city 
$$\rightarrow$$
 county: 0.985789 = d

$$4574 * 0.14 * (0.986 + (1-0.986) * 0.14) = 633$$

## **Underestimate:** fixed

```
EXPLAIN (ANALYZE, TIMING off)
SELECT * FROM zip_codes WHERE city = 'Oslo' AND county = 'Oslo';
                         QUERY PLAN
Seq Scan on zip_codes (cost=0.00..108.61 rows=634 width=36)
                       (actual rows=642 loops=1)
  Filter: ((city = 'Oslo'::text) AND (county = 'Oslo'::text))
  Rows Removed by Filter: 3932
Planning time: 0.235 ms
Execution time: 1.721 ms
(5 rows)
```

#### Overestimate #1: not fixed

Functional dependencies only work with equalities.

## Overestimate #2: not fixed :-(

The queries need to respect the functional dependencies.

ndistinct (GROUP BY)

```
EXPLAIN (ANALYZE, TIMING off) SELECT 1 FROM zip_codes GROUP BY county;
                              QUERY PLAN
HashAggregate (cost=3086.60..3090.87 rows=427 width=11)
                (actual rows=427 loops=1)
   Group Key: county
   -> Seg Scan on zip_codes (cost=0.00..2720.68 rows=146368 width=7)
                              (actual rows=146368 loops=1)
EXPLAIN (ANALYZE, TIMING off) SELECT 1 FROM zip_codes GROUP BY state;
                              QUERY PLAN
 HashAggregate (cost=3086.60..3086.79 rows=19 width=13)
                (actual rows=19 loops=1)
   Group Key: state
   -> Seq Scan on zip_codes (cost=0.00..2720.68 rows=146368 width=9)
                              (actual rows=146368 loops=1)
```

#### Nordic PGDay 2018 Oslo, March 13, 2018

```
SELECT attname, n_distinct
  FROM pg_stats WHERE tablename = 'zip_codes';
           | n_distinct
  attname
zip_code
city
                    1826
county
                     427
state
                      19
 longitude |
                   2393
latitude
                   2341
(6 rows)
```

```
EXPLAIN (ANALYZE, TIMING off)
SELECT 1 FROM zip_codes GROUP BY state, county;
```

#### **QUERY PLAN**

ndistinct(county, state) = ndistinct(county) \* ndistinct(state)

```
CREATE STATISTICS s (ndistinct)
    ON county, state, city
  FROM zip_codes;
ANALYZE zip_codes;
SELECT stxndistinct FROM pg_statistic_ext;
          stxndistinct
 {"2, 3": 1825, "2, 4": 1828,
  "3, 4": 429, "2, 3, 4": 1828}
(1 row)
```

```
EXPLAIN (ANALYZE, TIMING off)
SELECT 1 FROM zip_codes GROUP BY state, county;
                               QUERY PLAN
HashAggregate (cost=3452.52..3456.81 rows=429 width=20)
                (actual rows=429 loops=1)
  Group Key: state, county
   -> Seq Scan on zip_codes (cost=0.00..2720.68 rows=146368 width=16)
                              (actual rows=146368 loops=1)
Planning time: 0.227 ms
Execution time: 58.386 ms
(5 rows)
```

## ndistinct

- the "old behavior" was defensive
  - unreliable estimates with multiple columns
  - HashAggregate can't spill to disk (OOM)
  - rather than crash do Sort+GroupAggregate (slow)
- ndistincs coefficients
  - make multi-column ndistinct estimates more reliable
  - reduced danger of OOM
  - large tables + GROUP BY multiple columns

## **Future Improvements**

- additional types of statistics
  - MCV lists, histograms, ...
- statistics on expressions
  - currently only simple column references
  - alternative to functional indexes
- improving join estimates
  - using MCV lists
  - special multi-table statistics (syntax already supports it)
